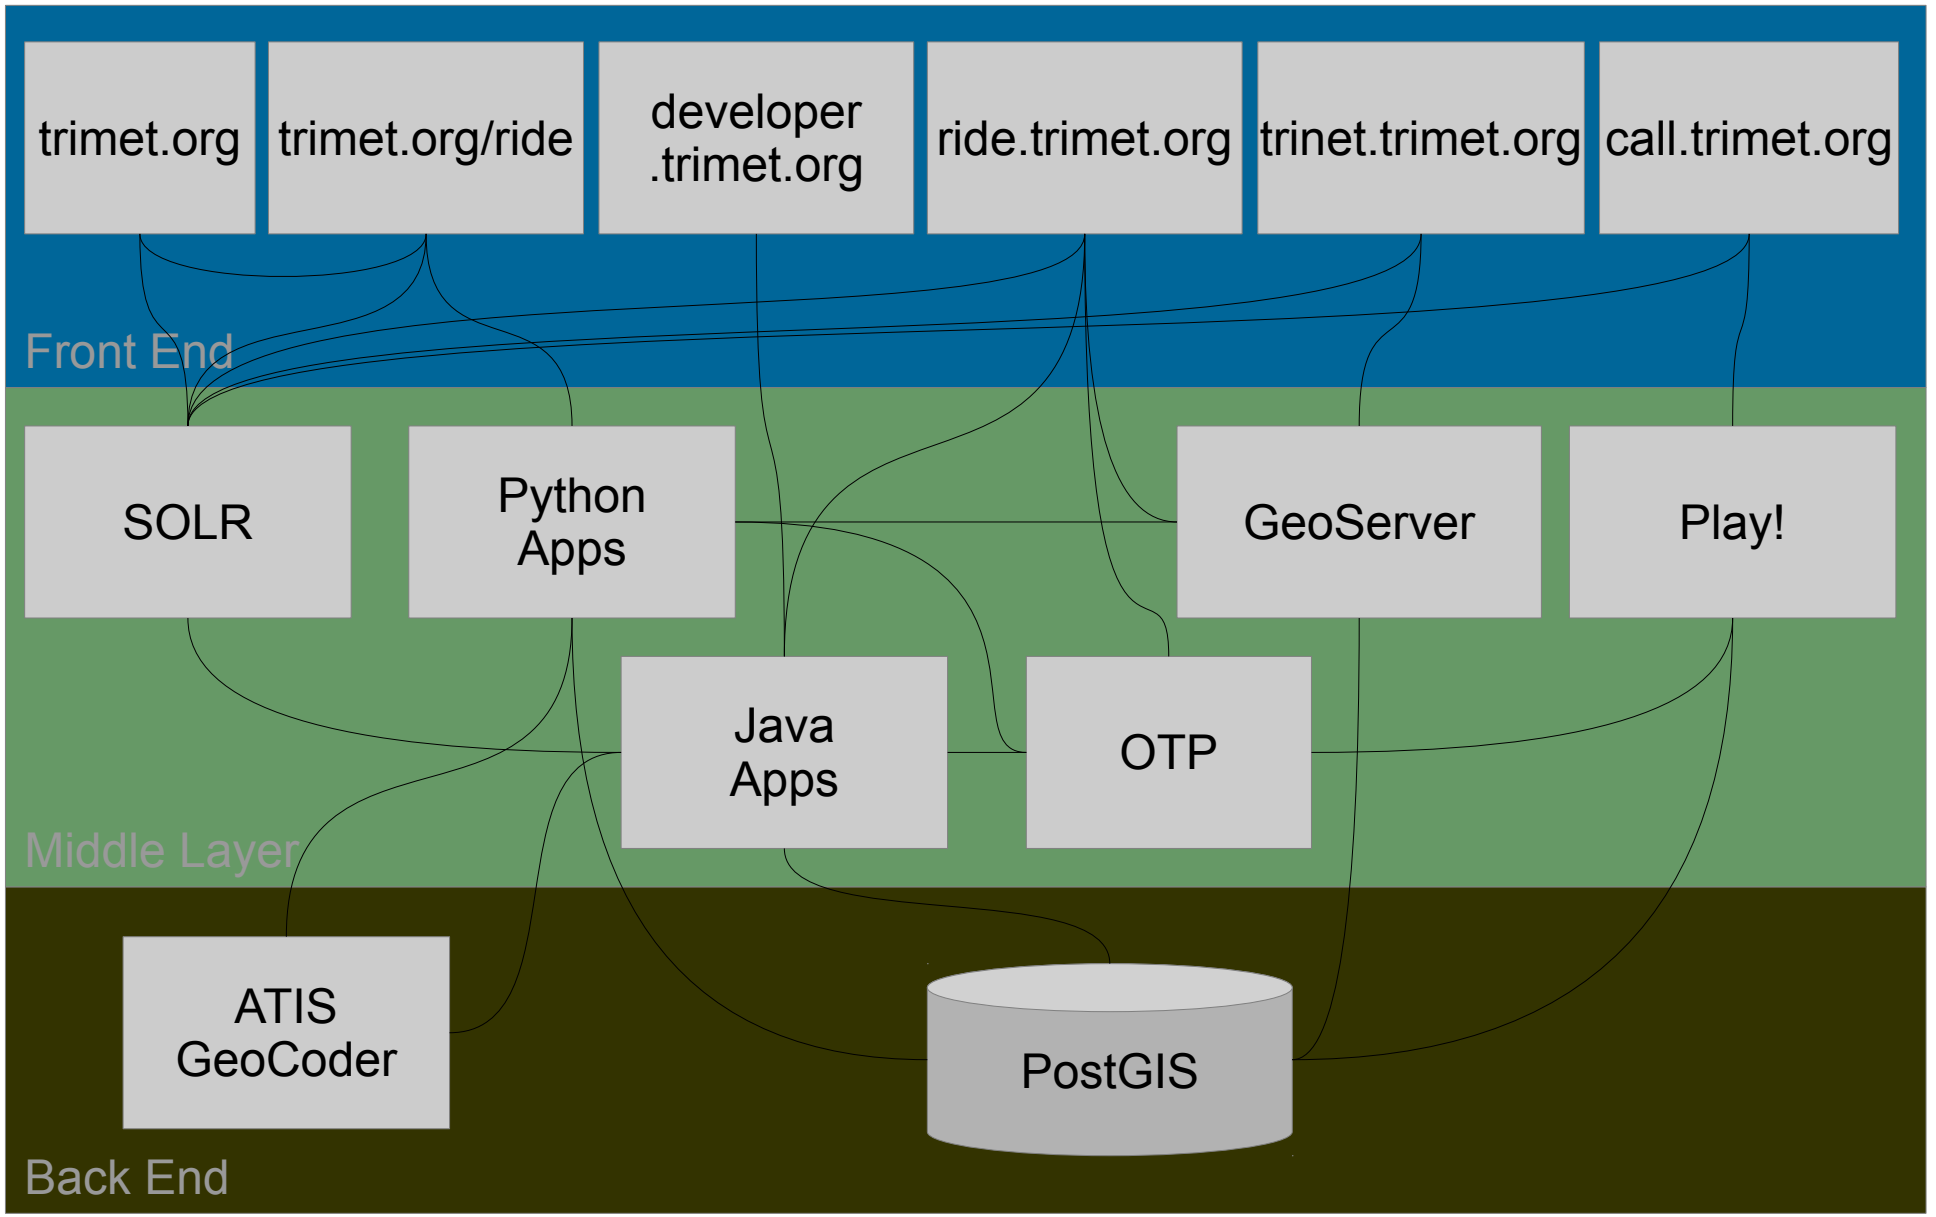
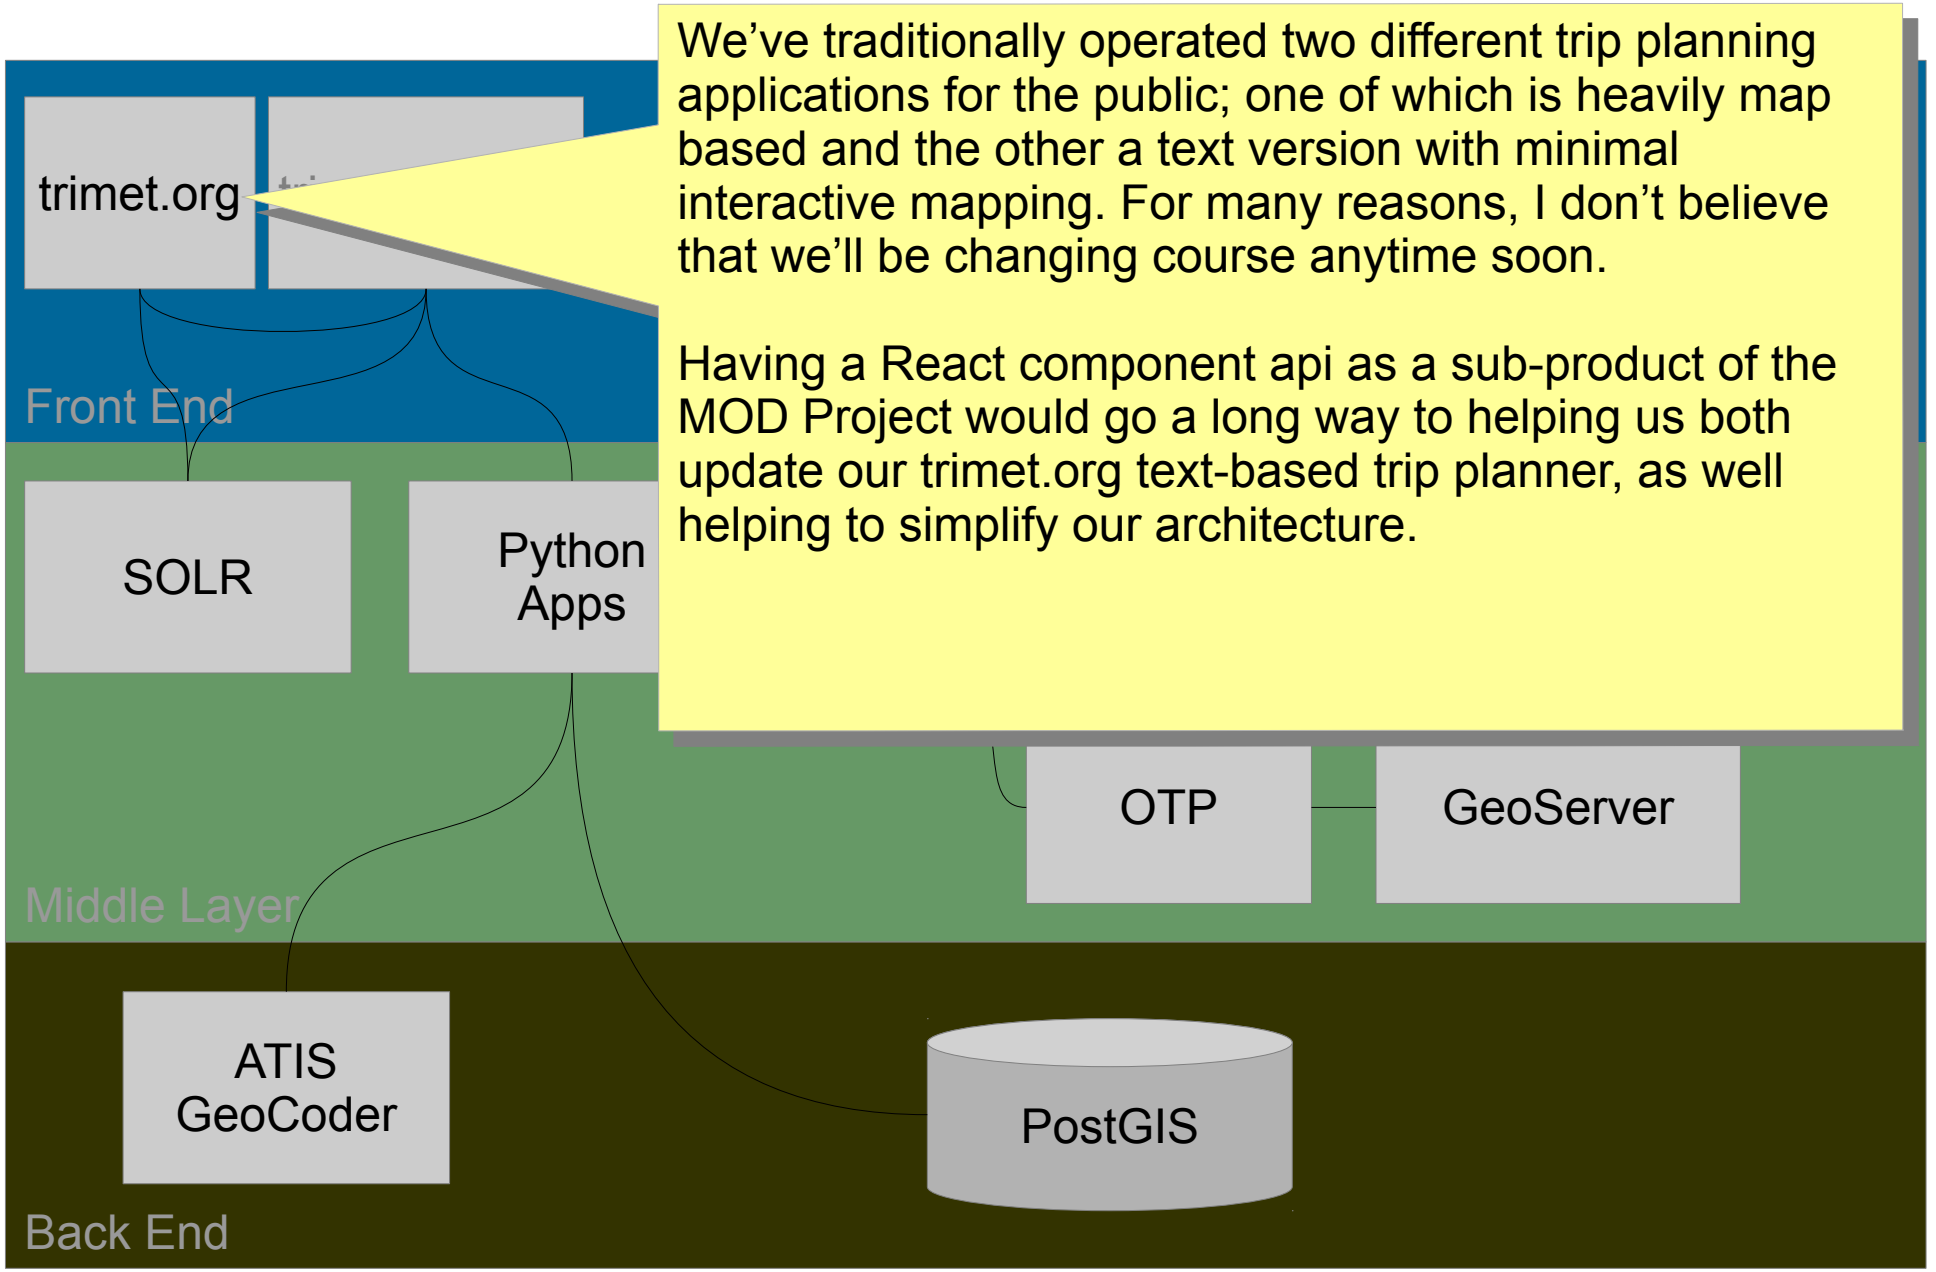
Connections



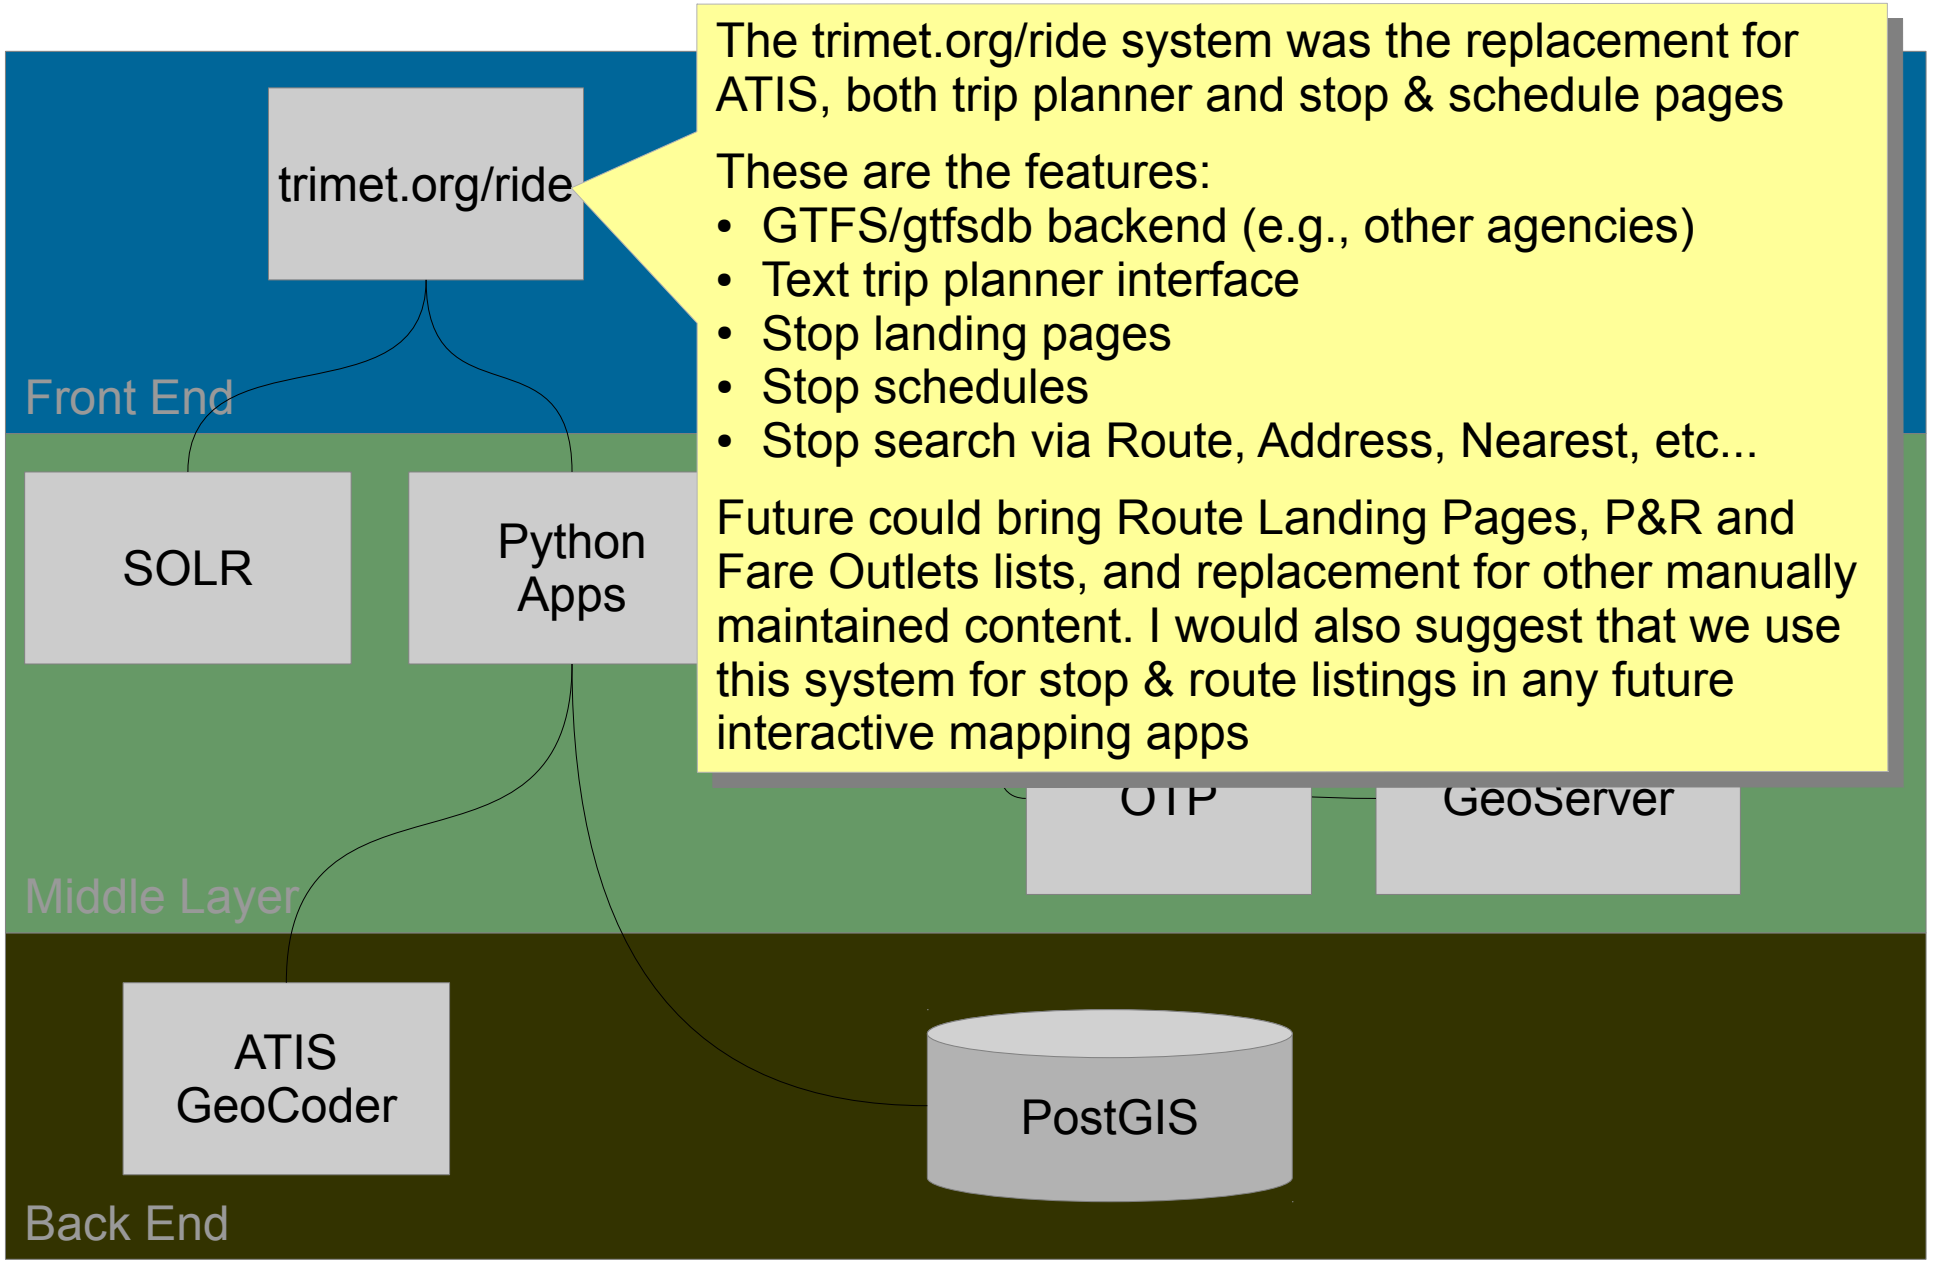
trimet.org explained



We've traditionally operated two different trip planning applications for the public; one of which is heavily map based and the other a text version with minimal interactive mapping. For many reasons, I don't believe that we'll be changing course anytime soon.

Having a React component api as a sub-product of the MOD Project would go a long way to helping us both update our trimet.org text-based trip planner, as well helping to simplify our architecture.

trimet.org/ride explained



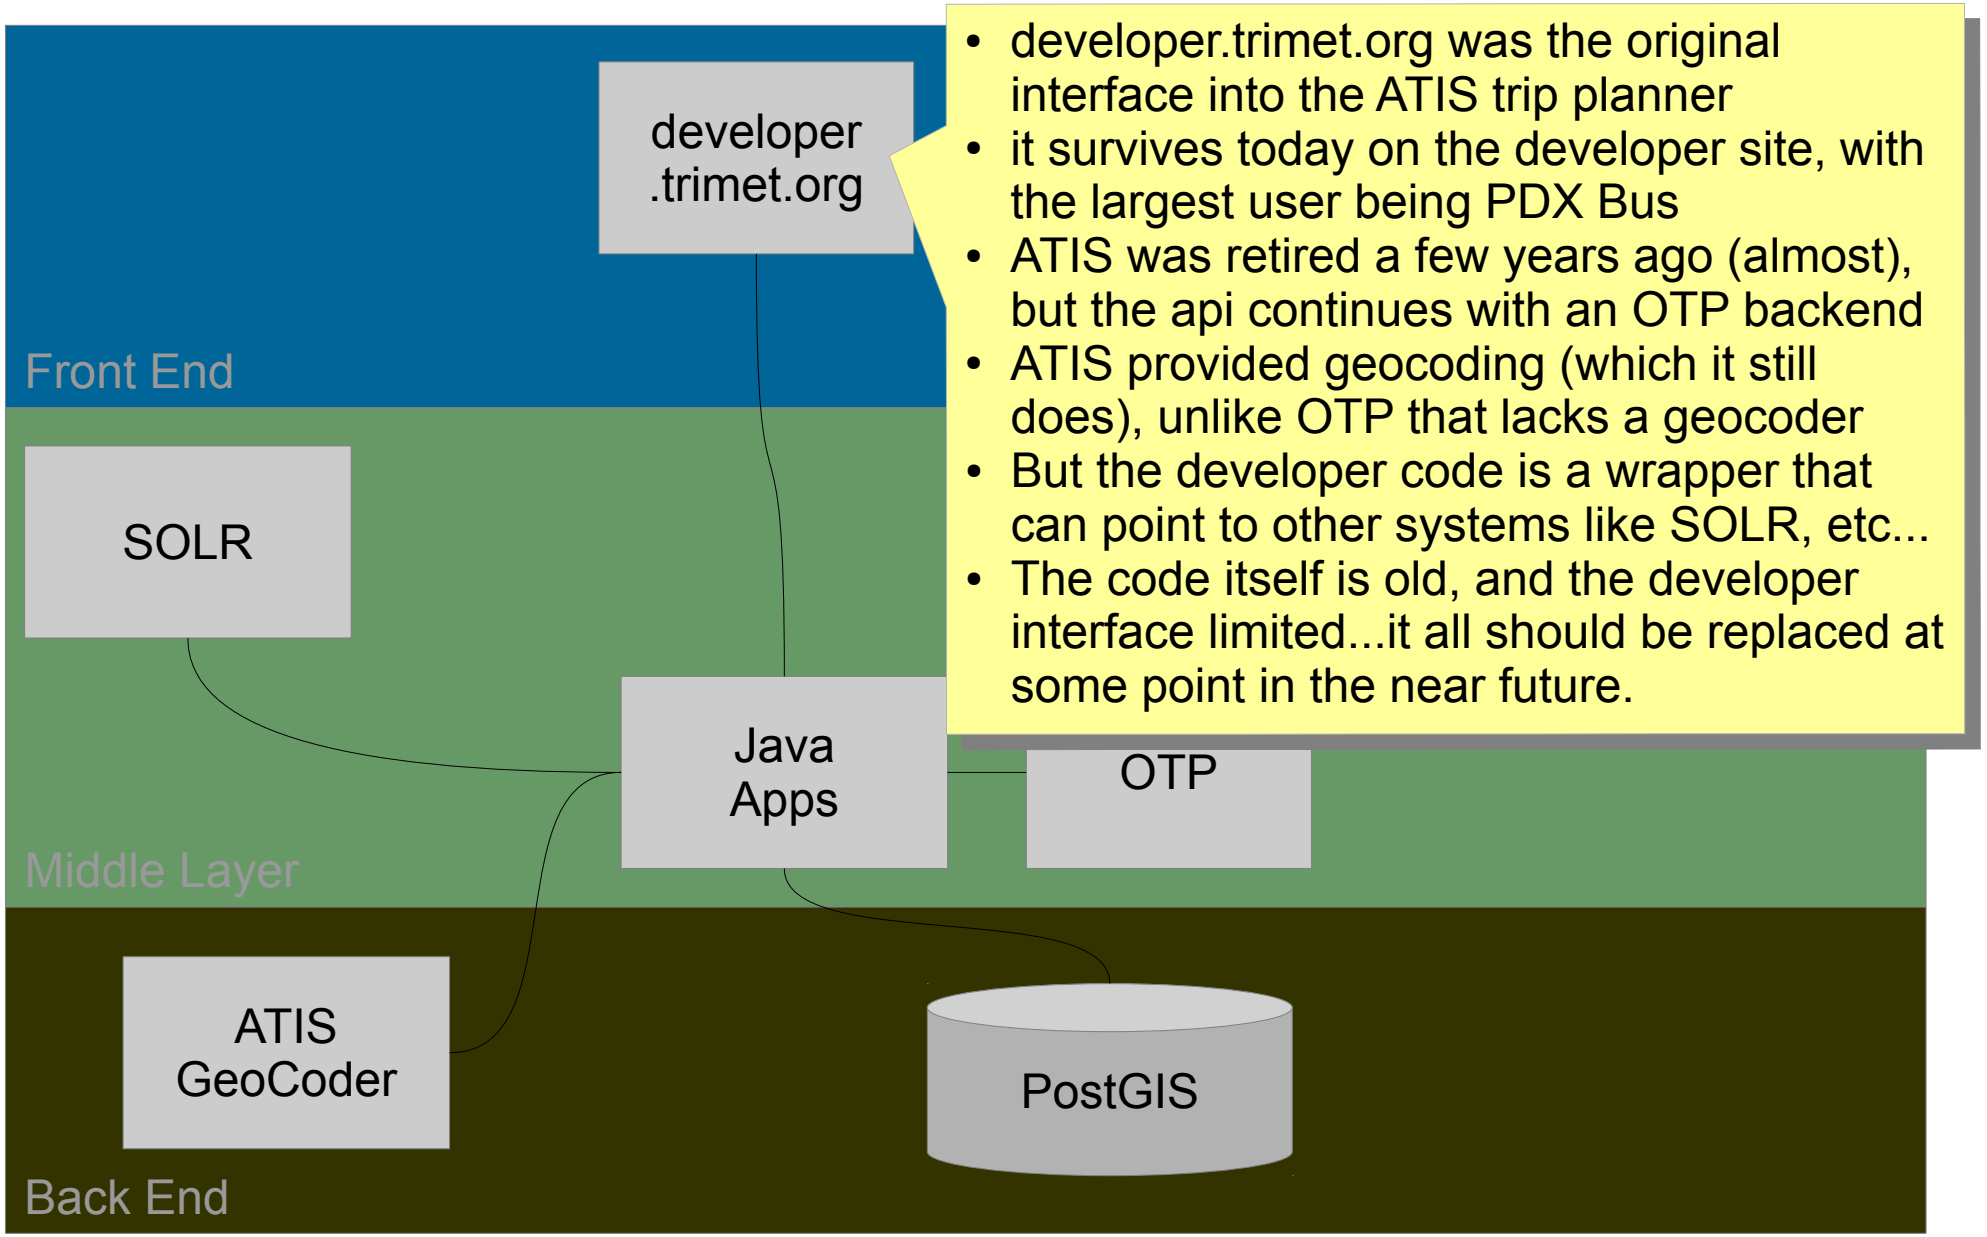
The trimet.org/ride system was the replacement for ATIS, both trip planner and stop & schedule pages

These are the features:

- GTFS/gtfsdb backend (e.g., other agencies)
- Text trip planner interface
- Stop landing pages
- Stop schedules
- Stop search via Route, Address, Nearest, etc...

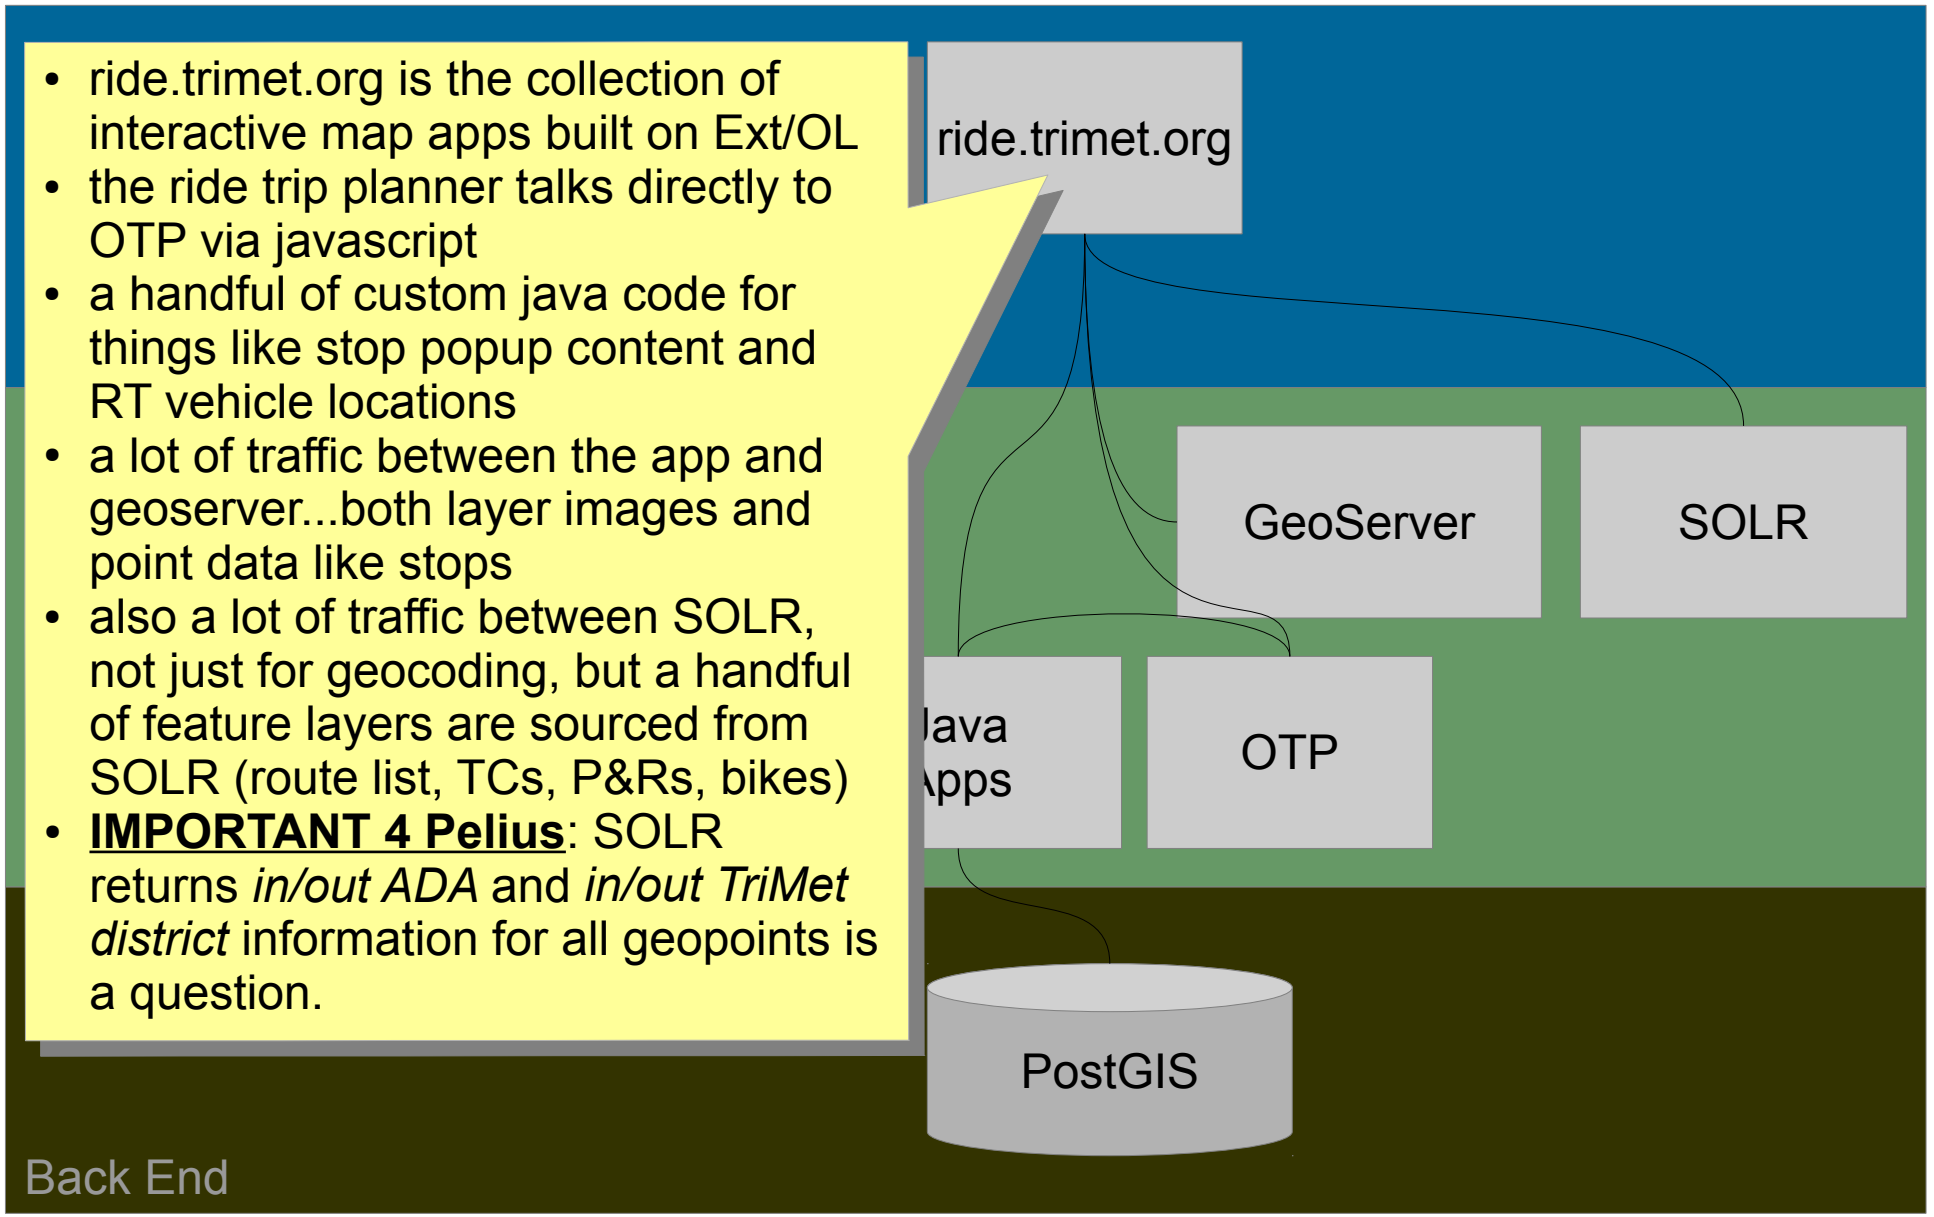
Future could bring Route Landing Pages, P&R and Fare Outlets lists, and replacement for other manually maintained content. I would also suggest that we use this system for stop & route listings in any future interactive mapping apps

developer.trimet.org



- developer.trimet.org was the original interface into the ATIS trip planner
- it survives today on the developer site, with the largest user being PDX Bus
- ATIS was retired a few years ago (almost), but the api continues with an OTP backend
- ATIS provided geocoding (which it still does), unlike OTP that lacks a geocoder
- But the developer code is a wrapper that can point to other systems like SOLR, etc...
- The code itself is old, and the developer interface limited...it all should be replaced at some point in the near future.

ride.trimet.org



- ride.trimet.org is the collection of interactive map apps built on Ext/OL
- the ride trip planner talks directly to OTP via javascript
- a handful of custom java code for things like stop popup content and RT vehicle locations
- a lot of traffic between the app and geoserver...both layer images and point data like stops
- also a lot of traffic between SOLR, not just for geocoding, but a handful of feature layers are sourced from SOLR (route list, TCs, P&Rs, bikes)
- **IMPORTANT 4 Pelius**: SOLR returns *in/out ADA* and *in/out TriMet district* information for all geopoints is a question.
